

The Explorer

Blockchain explorer is one of the essential tools in any cryptocurrency. These explorers provide information on the status of the blocks, transactions and currency. It is the browser for the blockchain, similar to how we have browsers like Mozilla or Google for internet web pages.

All cryptocurrency users rely heavily on blockchain explorers to track their transactions.

They are an open source web tool that allows you to view information about blocks, addresses, and transactions on the blockchain.

Having open-source explorers like these are what makes all cryptocurrencies transparent and immutable. Giving the public access to the blockchain ledger allows for a decentralized honor system to take place.

A block explorer quickly becomes a tool that everyone in cryptocurrency relies on virtually every day, yet they are far more versatile than people anticipate.

Syntropy, in keeping with its pledge of Transparency, makes available the Block Explorer for every coin it mines. You will find it located within each Node represented in the back office.
